3. How to Control External MCU

3.1. How to Send AT Commands

- When BT is NOT connected (for all commands)
- 1. Output low to P0.10 (UART PD pin) to enable UART interface. Please keep it enabling during the whole time when sending AT commands.
- 2. Send any AT commands you want.
- 3. Send command "AT+RESET" to save all your settings.
- 4. Output high or NC to P0.10 (UART PD pin) to turn off UART interface.
- When BT is connected (for AT?ADCVALUE, AT+DISCONNECT, AT+SLEEP, AT+SETGPIOnnHIGH, AT+SETGPIOnnLOW and AT+SETGPIOnnOFF only)
- 1. Output low to P0.10 (UART PD pin) to enable UART interface. Please keep it enabling during the whole time when sending AT commands.
- 2. Output low to P0.11 (flash default pin) to enable receiving AT commands when BT is connected. Please keep it low during the whole time when sending AT commands.
- Send "AT?ADCVALUE" or "AT+DISCONNECT" or "AT+SLEEP" or "AT+SETGPIOnnHIGH" or "AT+SETGPIOnnLOW" or "AT+SETGPIOnnOFF".
- 4. Output high or NC to P0.10 (UART PD pin) to turn off UART interface.
- 5. Output high or NC to P0.11 (flash default pin) to disable receiving AT commands when BT is connected.

3.2. How to Transmit Data

* Only when BT is connected *

- 1. Output low to P0.10 (UART PD pin) to enable UART interface. Please keep it enabling during the whole time when transmitting data.
- 2. Output high or NC to P0.10 (UART PD pin) to turn off UART interface.

3.3. How to Return to Flashed Default Setting

* Only when BT is NOT connected *

* Note that default baud rate is "9600bps,n,8,1". For other default, please check " 2.3 Default Info."

Use Hardware Method

- 1. Read P0.03 (indicator pin) first to check if BT is NOT in connection.
- 2. Output a low pulse to P0.11 (flash default pin), then system will return to default setting.

Use Software method

- Output low to P0.10 (UART PD pin) to enable UART interface. Please keep in enabling during the whole time when sending AT commands.
- 2. Send command "AT+DEFAULT", then system will return to default setting.

11. Notes and Cautions

Module is not designed to be used and lasting a lifetime. Like general products, it is expected to be worn out after continuous usage through the years. To assure that product will perform better and last longer, please

- Follow the guidelines of this document while designing circuit/end-product. Any
 discrepancy of core Bluetooth technology and technical specification of IC should refer
 to definition of Bluetooth Organization and Nordic Semiconductor as final reference.
- Do not supply voltage that is not within range of specification.
- Eliminate static electricity at any methods when working with the module as it may
 cause damage. It is highly recommended adding anti-ESD components to circuit design
 to prevent damage from real-life ESD events. Anti-ESD methods can be also applied in
 mechanical design.
- Do not expose modules under direct sunlight for long duration. Modules should be kept away from humid and salty air conditions, and any corrosive gasses or substances.
 Store it within -40°C to +125°C before and after installation.
- Avoid any physical shock, intense stress to the module or its surface.
- Do not wash the module. No-Clean Paste is used in production. Washing process will
 oxidize the shielding and have chemistry reaction with No-Clean Paste. Functions of the
 module are not guaranteed when it goes through washing process.

The module is not suitable for life support device or system and not allowed to be used in destructive device or system in any direct, or indirect ways. The customer is agreeing to indemnify Raytac for any losses when applying modules under such application as described above.
